

MadeToPrint

The output engine
for InDesign and XPress

“This Plug-In puts an end to output flaws and misprints; it surely takes InDesign to a higher prepress level.”
Mike Nellis, Orvis

“Before we had to open, check and update every document – one by one. Now MadeToPrint has taken over – this is just a relief.”
Paul Bourque, Bayard Inc.

MadeToPrint – Intelligent Printing and Exporting with InDesign and XPress

axaio MadeToPrint is the international standard solution for greater functionality, productivity and security for output with Adobe InDesign and QuarkXPress. Proven under the demands of everyday production, MadeToPrint is a user-friendly tool which optimizes exporting, archiving, checking and printing InDesign and XPress documents, including fully automated output.

MadeToPrint is a robust output engine designed to support prepress companies, publishing, marketing and design agencies and corporate publishing by facilitating streamlined, fast and faultless production of all output formats.

More Output Functionality

Is the output functionality of InDesign and QuarkXPress insufficient for your requirements? MadeToPrint enhances layout applications with many sophisticated and proven features. Within a MadeToPrint output job, you can define and save a multitude of additional functions and execute them with a simple mouse click. For example:

- Saving the output quickly: Define the target path and MadeToPrint saves output files to this location at the push of a button.

- Dynamic creation of target paths and folders: With MadeToPrint, you can even create branched folder structures auto-

matically and in parallel with the output.

- Automatic file naming: Entering file names manually is slow and prone to errors. MadeToPrint closes this gap in functionality by assigning names automatically, including information about the time, date, user, path and page number.

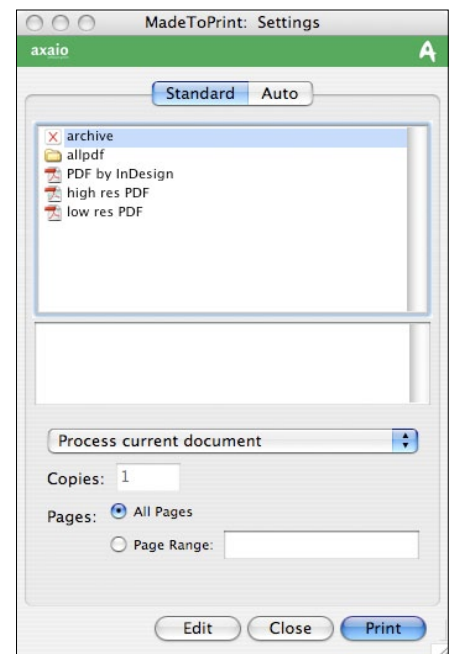

- Single page output: MadeToPrint generates a separate PDF/EPS or PS file from each page of a document. A token can then be used to transfer the corresponding page numbers to the respective file name.

- Individual layer output: Certain document layers are always printed (for example, with images and graphics) and other layers are printed alternately per document (such as text layers). This allows multi-lingual documents to be printed or exported in one go.

- Info bars on printouts and in PostScript-based files: Use MadeToPrint to print additional information directly in the output. Tokens can also be used

MadeToPrint supports Adobe InDesign, QuarkXPress, MS Windows and Mac OS X.

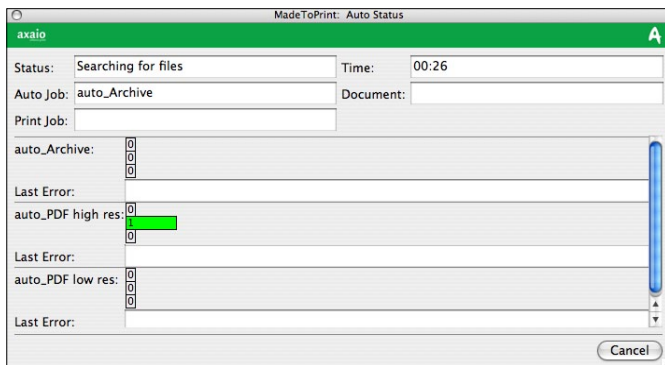

Output under control: MadeToPrint manages all export- and print jobs from one source.

here to determine and transfer a range of information about runtime.

- Imposition: Capability to output fully imposed PDFs to its feature set.

- Preflight: Do you check documents for missing or changed links and unloaded fonts before you output them? MadeToPrint carries out these checks before each output and reacts flexibly to errors for example, by issuing warning messages, updating image references, loading fonts temporarily or by terminating the output.

“Taking advantage of MadeToPrint, users are able to meet every output demand which may occur in modern editorial workflow environments.” Mark Walters, MEI

MadeToPrint Auto: open, preflight print, export and archive documents unattendedly.

Increased Output Productivity

First printing, then proofing and creating PDFs of varying resolutions before finally archiving. MadeToPrint combines these time-consuming individual steps to one single Job(set), all of which are completed with one click of your mouse. You can use Jobsets to simultaneously control any number of output devices and generate all possible formats. As such, MadeToPrint can handle even the most complex of tasks and output combinations efficiently and with ease.

Batch processing in MadeToPrint ensures a further boost to productivity. This function successively processes all InDe-

sign/XPress documents located in a specific folder. This allows you to output large quantities of files in one go.

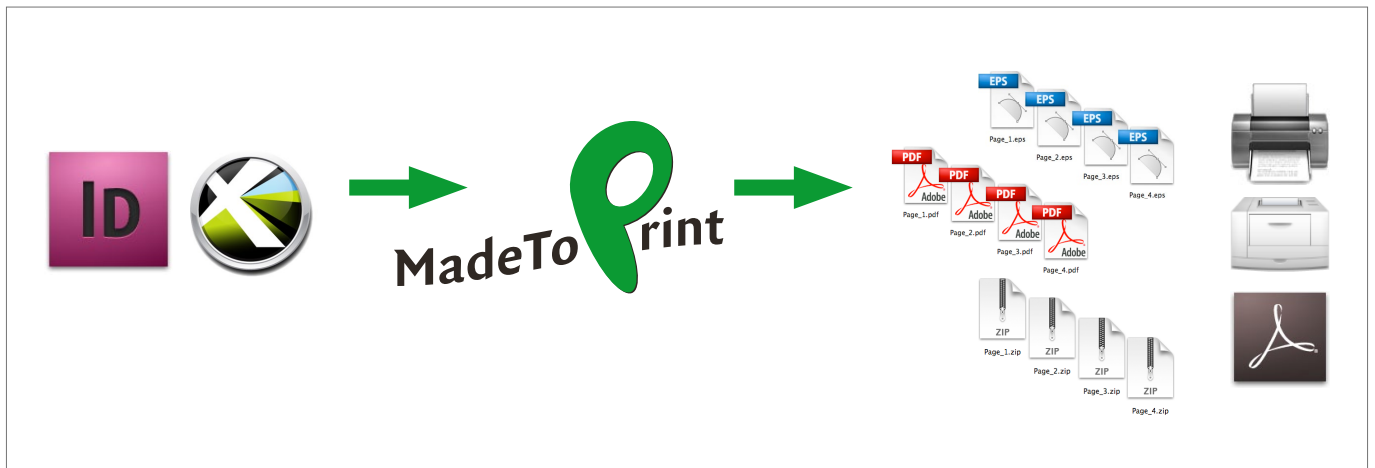

Maximum Productivity: MadeToPrint Auto

MadeToPrint Auto really kicks layout applications into life. Regular InDesign or QuarkXPress workstations become automated output servers for fully automatic printing and exporting. MadeToPrint permanently monitors input folders (Hot Folders) for incoming documents which it then opens and processes. MadeToPrint can be used in an internal network on a departmental to company-wide scale and handles printing, PDF creation and archiving 24 hours a day, 7 days a week.

Optimal Connection – Open Interfaces

MadeToPrint is distinguished by its open architecture. The key here is scripting. Scripts can be triggered and executed directly via MadeToPrint both before and after processing. Tasks that are not executed directly by MadeToPrint can often be completed using integrated scripts.

The Auto Versions of MadeToPrint support the FullSWITCH and PowerSWITCH workflow systems from Enfocus. Configurators allow MadeToPrint to be integrated as a component in SWITCH (work)flows via drag-and-drop. Select a print job and MadeToPrint controls the print and data output directly from SWITCH. All Plug-In functions are also available in combination with SWITCH.

Output all prepress file formats as single pages – address multiple output devices simultaneously.

MadeToPrint

State-of-the-art Integration: MadeToPrint for Editorial Systems

Those who use Editorial Systems want to be able to link the output to conditions or statuses that have layouts, articles and images within the system. This is no mean task, but it is one which MadeToPrint handles with precision.

The Plug-in is seamlessly interlocked with InDesign and QuarkXPress and

performs its service reliably in the background. MadeToPrint acts automatically when a layout status changes or when searching for output queues. The integration encompasses the action-controlled output, the transfer of information from the database and the confirmation sent to the system after printing and data export.

Moreover, MadeToPrint is capable of checking out layouts unattendedly, updating contents right before output

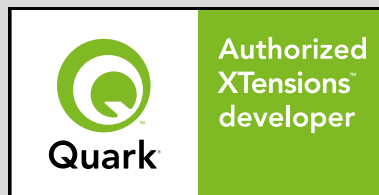

and checking layouts back into the database of the editorial system. The Plug-In helps to keep publication components up to date and output statuses under control.

Many international editorial houses and major publishers count on MadeToPrint as an indispensable part of their production workflows - whether it is in conjunction with vjoon K4, Woodwing Smart Connection Enterprise or Quark QPS.

Versions

- MadeToPrint InDesign/InCopy and XT (for Quark XPress) Standard
- MadeToPrint InDesign and XT (for Quark XPress) Auto
- MadeToPrint InDesign Auto K4 (for integration with vjoon K4)
- MadeToPrint InDesign Auto SCE (for integration with Woodwing SCE)
- MadeToPrint XT Auto QPS (for integration with Quark QPS)
