New SpectraView Profiler 2 product range

The SpectraView Profiler 2 bundle combines hardware calibration with the same software and technology utilized for the fogra pre certified SpectraView reference monitors, at a more competitive price.

The profiler 2 bundle includes

1x Multisync monitor
1x SpectraView Profiler software
Additional option: hood

SpectraView Profiler 2 Vs. SpectraView II

The difference between the SpectraView Profiler 2 and the SpectraView II lies in the calibration methodology used. The SpectraView Profiler 2 software is based on the advanced technology used for the fogra pre-certified SpectraView reference monitors. The SpectraView II does not adopt this same advanced technology.

When purchasing a SpectraView Profiler 2, you are also purchasing a higher level of colour accuracy and validation process, as well as superior after sales support by colour experts.

ColourProcess introduced the NEC SpectraView monitors to the Australian market in 2007 to compete with the EIZO ColorEdge monitors for the colour critical market. ColourProcess endorses the SpectraView Profiler 2 over the SpectraView II because the product continues to outperform the colour accuracy of the EIZO ColorEdge monitor.

Advantages of SpectraView Profiler 2

- Software can be used on any display panel
- User friendly interface
- 1024 bit grey level calibration
- Superior after sales support
- Easy management for the IT department
- Ability to calibrate both displays connected to your laptop (i.e. MultiSync + laptop displays)
- fogra Pre-certified for softproofing with SpectraView Reference
